

SWE 4504

Scapy and Email Sniffer

Task 1

1. Make a simple sniffer using Scapy library.
2. You will sniff only those packets that are generated from nostarch.com
3. No need to store packets, however sniff indefinitely.

Hints:

1. Find IP address of nostarch.com
2. Use different BPF filter syntax to do the above task.
3. You might need two terminals. One to execute the code and another to ping targeted host.

Error handling:

1. Use Python 3.11.9
2. No need to use virtual environment since Scapy built-in library of python 3.11.9

Task 2

1. You will make a simple mail sniffer using smtpplib (another built-in python library)
2. You need two files to build this sniffer. One file for sniffer and another one for a client who will create an email and send that email to a free smtp server located at 104.237.130.88
3. Make sure to change the receiver of the mail. **Don't flood my email Account.**

Hints:

1. You need to two terminals. Refer to Chapter 4 or slide 8.

Error handling:

1. Use Python 3.11.9
2. No need to use virtual environment since smtpplib and scapy both are built-in library of python 3.11.9
3. Make sure to save your code before executing them.
