

SWE 4504

All About Sniffer

Task 1

1. Make a simple sniffer using Scapy library.
2. You will sniff only those packets that are generated from google.com
3. No need to store packets, however sniff only one packet.

Hints:

1. Find IP address of google.com
2. Use different BPF filter syntax to do the above task.
3. You might need two terminals. One to execute the code and another to ping targeted host.

Error handling:

1. Use Python 3.11.9
2. No need to use virtual environment since Scapy built-in library of python 3.11.9

Task 2

1. To do this task you **can not use scapy library**.
2. Find all the active host in your subnet.
3. For example, your subnet is '192.168.39.0/24' since your ip address is '192.168.39.19'. Your task is to find active host from 192.168.39.1 to 192.168.39.254

Hints:

1. After running the the sniffer (that will sniff out the active hosts) you might need to press CTRL+C and will find output like the bottom right image.

```
Summary: Hosts up on 192.168.39.0/24
192.168.39.124
192.168.39.13
192.168.39.15
192.168.39.18
192.168.39.19 *
192.168.39.21
192.168.39.224
192.168.39.4
192.168.39.88
```
